

Reccodo – Getting Started Guide

This document will describe the structure of the product feed as well as provide guidelines on how to embed the Reccodo script to your website.

PRODUCT FEED INFORMATION

The product feed from your website, will provide Reccodo with accurate information about your product range and will enable an effective content analysis.

The feed should be in either XML or JSON format. Please find examples at the end of the present document.

General Requirements

In general, your file must meet the following criteria:

- It must be available online, publicly accessible and retrievable by a HTTP GET request.
- It must match the structure described below and all required fields should be filled in.
- There should not be any duplicate products. Duplicates may affect the quality of the results. Products are identified by their unique_id.
- Prices should include V.A.T.
- If you support multiple languages under the same domain, please [contact us](#).

You can use our [product feed validator](#) to check for errors and compliance issues. The error report will provide good indications on how to fix your errors.

Important! All products in the product feed may be recommended to the customer.

Attributes

The table below analyzes all the attributes that are accepted for each product by Reccodo. Optional fields, although not affecting the functionality of our recommendation algorithms, can significantly **improve** their performance if provided.

Reccodo – Getting Started Guide

NAME	TYPE	LENGTH	REQUIRED	EXAMPLE	COMMENTS
unique_id	String	255	Yes	4567321	
title	String	255	Yes	SuperGlasses X3 Black	Short description of the product
image	String	200	Yes	http://www.mystore.com/product/4567321.jpg	The most representative image of the product
price_with_vat	Decimal	-	Yes	134.66	Don't include currency sign
url	String	200	Yes	http://www.mystore.com/prod/4567321	
category	String	255	Yes	Eyewear > Smart Devices	Demonstrate Category tree with ">"
category_id	String	255	No	1567,1567SF, ...	Comma Separated Values. If applicable, will enable category recommendations
in_stock	Boolean	-	No	{true, false}	
manufacturer	String	70	No	SuperGlasses	
mpn	String	100	No	ZHD321	manufacturer identifier of the product
ean	String	13	No	9780471117094	international article number (EAN) used for the identification of retail products
weight	Integer	-	No	140	
color	String	50	No	Black	
size	String	255	No	XL, L, M, S	All the available sizes for the product.
old_price_with_vat	Decimal	-	No	185.99	If product on offer, this is the original price.
optional_note	String	50	No	On offer until 2/3	

EMBED TRACKING SCRIPT

The embed script enables the data exchange between your website and Reccodo. The script needs to be present on every page similarly to analytics scripts such as Google's, hence we suggest including it in a main page template, if one is available.

We recommend placing the code in <head> section of the site or at least on top of the <body> so that it is loaded before a page renders on a browser. The script will load asynchronously and will not affect your page load time.

Please copy & paste the following:

```
<script>(function(d, s, id) {  
    var js, sjs = d.getElementsByTagName(s)[0];  
    if (d.getElementById(id)) return;  
    js = d.createElement(s); js.id = id;  
    js.type = 'text/javascript';  
    js.async = true;  
    js.src = "https://app.reccodo.com/static/js/reccodo.min.js";  
    sjs.parentNode.insertBefore(js, sjs);  
})(document, 'script', 'reccodo-js');  
</script>
```

BASKET TRACKING

Tagging shopping cart aims to improve overall recommendation performance, analyze and produce frequent item sets to increase basket value and track abandoned carts to retarget customers.

On each page that is containing a shopping cart – including the mini-shopping cart modal usually placed on the top right-hand corner - you should add the following snippet in the page, with the products that are **currently in the basket**. Basket tracking should be activated after the submission of the product feed.

Reccodo – Getting Started Guide

```
<div
class="scibyl_cart" style="display:none">
  <div class="scibyl_cart_item">
    <span class="product_id">XXXXXX</span>
    <span class="quantity">2</span>
    <span class="unit_price">501.30</span>
    <span class="currency_code">EUR</span>
    <span class="size">M</span>
  </div>
  <div class="scibyl_cart_item">
    <span class="product_id">YYYYYY</span>
    <span class="quantity">3</span>
    <span class="unit_price">61.50</span>
    <span class="currency_code">EUR</span>
    <span class="size">M</span>
  </div>
  .
  .
</div>
```

In the order confirmation page (the page where the user lands after a successful purchase), you should **replace** it with the following snippet to confirm the purchase.

```
<div class="scibyl_cart_purchased" style="display:none">
  <div class="scibyl_cart_item">
    <span class="product_id">XXXXXX</span>
    <span class="quantity">2</span>
    <span class="unit_price">501.30</span>
    <span class="currency_code">EUR</span>
    <span class="size">M</span>
  </div>
  <div class="scibyl_cart_item">
    <span class="product_id">YYYYYY</span>
    <span class="quantity">3</span>
    <span class="unit_price">61.50</span>
    <span class="currency_code">EUR</span>
    <span class="size">M</span>
  </div>
  .
  .
</div>
```

If the webpage is built as a single page application, or the cart is changing dynamically you may update the basket by calling the following JS function:

```
<script>
var b = new Basket();
b.basket_update();
</script>
```

Reccodo – Getting Started Guide

EMBED WIDGET

Upon creating your account at Reccodo, you should configure the recommendations widgets. There are several widget types that you can choose from, each of them carrying a separate configuration.

1. Homepage recommendations
2. Product Related Recommendations
3. Category Recommendations (*category_id should be present in product feed)
4. Frequent Item set (Bundles)
5. Checkout page recommendations

For each of them you should reserve a space in your website for Reccodo to present them. This is done by adding a snippet like the following in the HTML.

The exact snippet will be **autogenerated** in the dashboard, when you create a widget.

```
<div id="sbl_recommendations" data-widget-uid="....." data-widget-type="....."></div>
```
